

MODULE 3

1.What are the four important <meta> tags we use in SEO?

The four important <meta> tags used in SEO:

1.Meta Title Tag:The meta title tag specifies the title of a web page, which appears as the clickable headline in search engine results.

2.Meta Description Tag:The meta description tag provides a brief summary of a web page's content. It influences click-through rates from search engine results but does not directly impact rankings.

3.Meta Keywords Tag: Historically used to specify keywords relevant to the page's content. its significance has diminished over time, and many search engines no longer consider it for rankings.

4. Meta Robots Tag: Provides search engine crawlers with instructions on how to index and follow links on the page.

2.What is the use of open-graph tags in a website?

Open Graph tags are a set of meta tags that allow websites to control how their content is displayed when shared on social media platforms like Facebook, LinkedIn, or Twitter. These tags help ensure that shared links display relevant and visually appealing information, increasing engagement.

Open Graph tags optimize how your website's content looks when shared, which can lead to more visibility, better user engagement, and enhanced user experience across social platforms.

Use of open-graph tags:

- 1.Enhanced Link Previews
- 2.Consistent Branding
- 3.Increased Click-Through Rates (CTR)
- 4.Control over Shared Content
- 5.Improved SEO for Social Platforms

3.What tag we will use to add an image to the website? Explain the points we should care about while adding the image to the website.

```

```

Important Points to Remember:

1.Image Format: Use formats like JPEG, PNG, or GIF. Each format has different strengths. JPEG is good for photos, PNG for graphics with transparency, and GIF for simple animations.

2.Image Size: Make sure the image size is appropriate for your website. Large images can slow down your page loading time.

3.Image Optimization: Use tools to compress your images without losing too much quality. This helps with page speed.

4.Image Placement: Decide where you want the image on your page. You can use HTML to position it accurately.

5.Accessibility: Always use the alt attribute to describe the image for people who can't see it. This makes your website more inclusive.

6.Copyright: Make sure you have the right to use the image. Using images without permission is illegal.

4.What is the difference between NOFOLLOW and NOINDEX?

Nofollow: When the Nofollow directive is applied to a link, it instructs search engines not to crawl the linked page. This means the search engine will see the link but won't follow it to the destination page. Consequently, the linked page won't be added to the search engine's crawling queue from that link.

Noindex: Noindex is an instruction that you apply to a whole webpage. When a page is set to Noindex, it tells search engines not to include that page in their search results. Essentially, the page is invisible in search engines.

5.Explain the types of queries.

There are four main types of queries.

1. Navigational Queries

Definition: These are queries where the user is trying to find a specific website or webpage. The user typically already knows where they want to go but uses a search engine to navigate there instead of typing the URL directly. ex., "YouTube" or "Google"

2. Informational Queries

Definition: These queries are made by users seeking information or answers to specific questions. The intent here is to learn more about a topic, find an answer, or gain knowledge. ex., "How to bake a cake" or "Benefits of meditation"

3. Transactional Queries

Definition: These queries indicate an intent to perform a transaction, such as making a purchase, signing up for a service, or taking some form of online action. ex., "Order pizza" or "Buy iPhone 14"

4. Commercial Queries

Definition: These queries are made by users who are considering a purchase or other action but are still researching their options. They want to compare products, read reviews, or find the best option before making a decision. ex., "Best smartphones 2024" or "Find a good dentist"

6. What is the importance of Sitemap and Robots.txt in SEO?

Sitemap: A sitemap tells search engines which pages and files you think are important in your site, and also provides valuable information about these files. For example, when the page was last updated and any alternate language versions of the page.

Robots.txt: Robots.txt is a regular text file that through its name has special meaning to the majority of "honorable" robots on the web. By defining a few rules in this text file, you can instruct robots to not crawl and index certain files, directories within your site, or at all.

7. Below is the list of pages for an e-commerce site that doesn't need to be crawled by any crawler.

o Admin pages

o Cart page

o Thank-you page

o Images

How will you achieve this?

To prevent search engines from crawling specific pages and directories on your e-commerce site, you can use the **robots.txt** file.

Add Directives to Block Specific Pages and Directories:

A sample configuration for the robots.txt file to block the specified pages and directories:

User-agent: *

Disallow: /admin/

Disallow: /cart

Disallow: /thank-you

Disallow: /images/

8. What are on-page and off-page optimization?

On-page optimization and **off-page optimization** are two fundamental aspects of SEO that work together to improve a website's visibility and ranking in search engine results.

On-Page Optimization:

On-page optimization refers to the practices and strategies implemented directly within the website to improve its search engine rankings and user experience. It involves optimizing individual web pages to make them more relevant and accessible to both users and search engines.

Key Elements of on page optimization:

- 1.Content Quality:
- 2.Keyword Optimization:
- 3.URL Structure:
- 4.Internal Linking:
- 5.Image Optimization:
- 6.Mobile Friendliness:
- 7.Page Speed:
- 8.Schema Markup:

Off-Page Optimization:

Off-page optimization involves strategies and activities that occur outside of your website to improve its search engine rankings and overall online presence. It focuses on building authority, credibility, and trust for your website through external factors.

Key Elements of off- page optimization:

- 1.Backlink Building:
- 2.Social Media Engagement:
- 3.Influencer Marketing:
- 4.Online Reputation Management:
- 5.Content Marketing:
- 6.Local SEO:
- 7.Social Bookmarking:

**9.Perform an on-page SEO using available tools for
www.designer2developer.com**

ON PAGE SEO CHECKLIST

Website:- www.designer2developer.com

Product Schema

FAQ Schema

Review Schema

Local business Schema

Breadcrumb Schema

Off-page SEO:

Link building,

Social Media Engagement,

Online Reviews,

Social Bookmarking,

Podcast & Webinars,

Blog posting.

11.What are the characteristics of “bad links”?

"Bad links," also known as toxic or harmful backlinks, can negatively impact a website's search engine ranking and overall SEO health. Identifying and avoiding these types of links is crucial to maintaining a strong online presence.

key characteristics of bad links:

1.Low-Quality Sites: Links from websites that have low domain authority, are poorly designed, or are not relevant to your niche can be considered bad.

2.Spammy Websites: Links from sites known for spammy content, including link farms or sites that engage in deceptive practices, can negatively impact your SEO.

3.Irrelevant Links: Backlinks from unrelated sites can confuse search engines about your site's relevance and authority.

4.Over-Optimized Anchor Text: If the anchor text is overly optimized with targeted keywords, it can signal manipulative linking practices.

5.NoFollow Links: While NoFollow links are not inherently bad, a high percentage of NoFollow links compared to DoFollow links may indicate a lack of trust from other sites.

6.Link Exchanges: Excessive reciprocal linking or link exchanges with low-quality sites can appear manipulative.

7.Broken Links: Links that lead to 404 pages or unresponsive sites can harm user experience and SEO.

8.Links from Penalty-Affected Sites: Links from websites that have been penalized by search engines can pass on negative SEO effects.

9.Thin Content: Links from pages that contain little or no valuable content can be seen as low-quality.

Conclusion

Bad links can significantly harm a website's SEO efforts, potentially leading to penalties or a drop in search engine rankings. It's essential to regularly audit your backlink profile and disavow any toxic links that could negatively impact your site's performance. Prioritize building high-quality, relevant links that add value to your website and align with search engine guidelines.

12.Perform Keyword Research then create a blog on “Importance of IT Training” and provide a link to TOPS Technologies and connect it with the webmaster and Google Analytics.

<https://importance-of-it-training.blogspot.com/2024/09/httpsimportance-of-it-training.blogspot.com.html>

13.What is the use of Local SEO?

Local SEO is the process of optimizing your online presence to attract more business from relevant local searches. These searches take place on Google and other search engines and typically include phrases like "near me" or "in (city/area)."

1.Increases Local Visibility: Local SEO helps your business appear in local search results, especially in Google's "Local Pack". This improves visibility for nearby customers actively looking for products or services.

2.Attracts Nearby Customers: With Local SEO, businesses can target customers in a specific geographic area, making it easier for them to find businesses close to them. This is especially important for brick-and-mortar stores, restaurants, and service-based businesses.

3.Improves Credibility: Local SEO includes reviews, ratings, and Google My Business profiles, which show up in search results. Positive reviews and detailed business information increase the credibility and trustworthiness of your business.

4.Mobile Search Optimization: Local SEO is especially beneficial for mobile searches, as many people use smartphones to find local services while on the go. Optimizing for mobile search increases the chances of users finding and contacting your business.

5.Helps with Map Listings: Local SEO helps businesses appear in map searches, which is critical for businesses like restaurants, hotels, or shops that rely on physical foot traffic.

Local SEO is essential for businesses that want to target local customers, increase foot traffic, and establish a strong presence in their community.
